

For flange couplings standardized flanges are used complying with EN / DIN or ASTM. The flange coupling can be swivel or fixed. A flange-to-hose connection should preferably be fitted with at least one swivel flange. During assembly, the connection with the fixed flange is fitted to the pipe system first, followed by the swivel flange.

The swivel flange prevents twisting of the hose during assembly.

For flange couplings, flanges complying with EN 1092-1 / DIN 2673 and ASTM A 182 ANSI B16.5 are used. Always connect flanges of the same standard EN/DIN or ASTM and pressure range. Due to difference in overall dimensions ASTM and EN / DIN flanges can not be connected.

In the next table you'll find an overview of flange types with their corresponding pressure classes.
